SoilR ages and system transit time vs geochemistry
Predictors with |median Spearman rho| >= 0.5 for at least one persistence outcome; all correlations shown for retained predictors
fPOM mean age
oPOM mean age
MAOM mean age
System mean transit time

−1.0
ependent treatment−level observations. Posterior draws propagate SoilR uncertainty; they do not increase the number of independent treatments. Strong correlations are an exploratory descriptive filter, not a significance test.
