SoilR rates, transfer coefficients, ages and transit time vs geochemistry
Predictors with |median Spearman rho| >= 0.5 for at least one SoilR outcome; all correlations shown for retained predictors
fPOM decomposition rate (kf)
oPOM decomposition rate (ki)
MAOM decomposition rate (ks)
fPOM −> oPOM transfer (alpha_fi)
oPOM −> MAOM transfer (alpha_is)
fPOM mean age
oPOM mean age
MAOM mean age
System mean transit time

ependent treatment−level observations. Posterior draws propagate SoilR uncertainty; they do not increase the number of independent treatments. Strong correlations are an exploratory descriptive filter, not a significance test.
